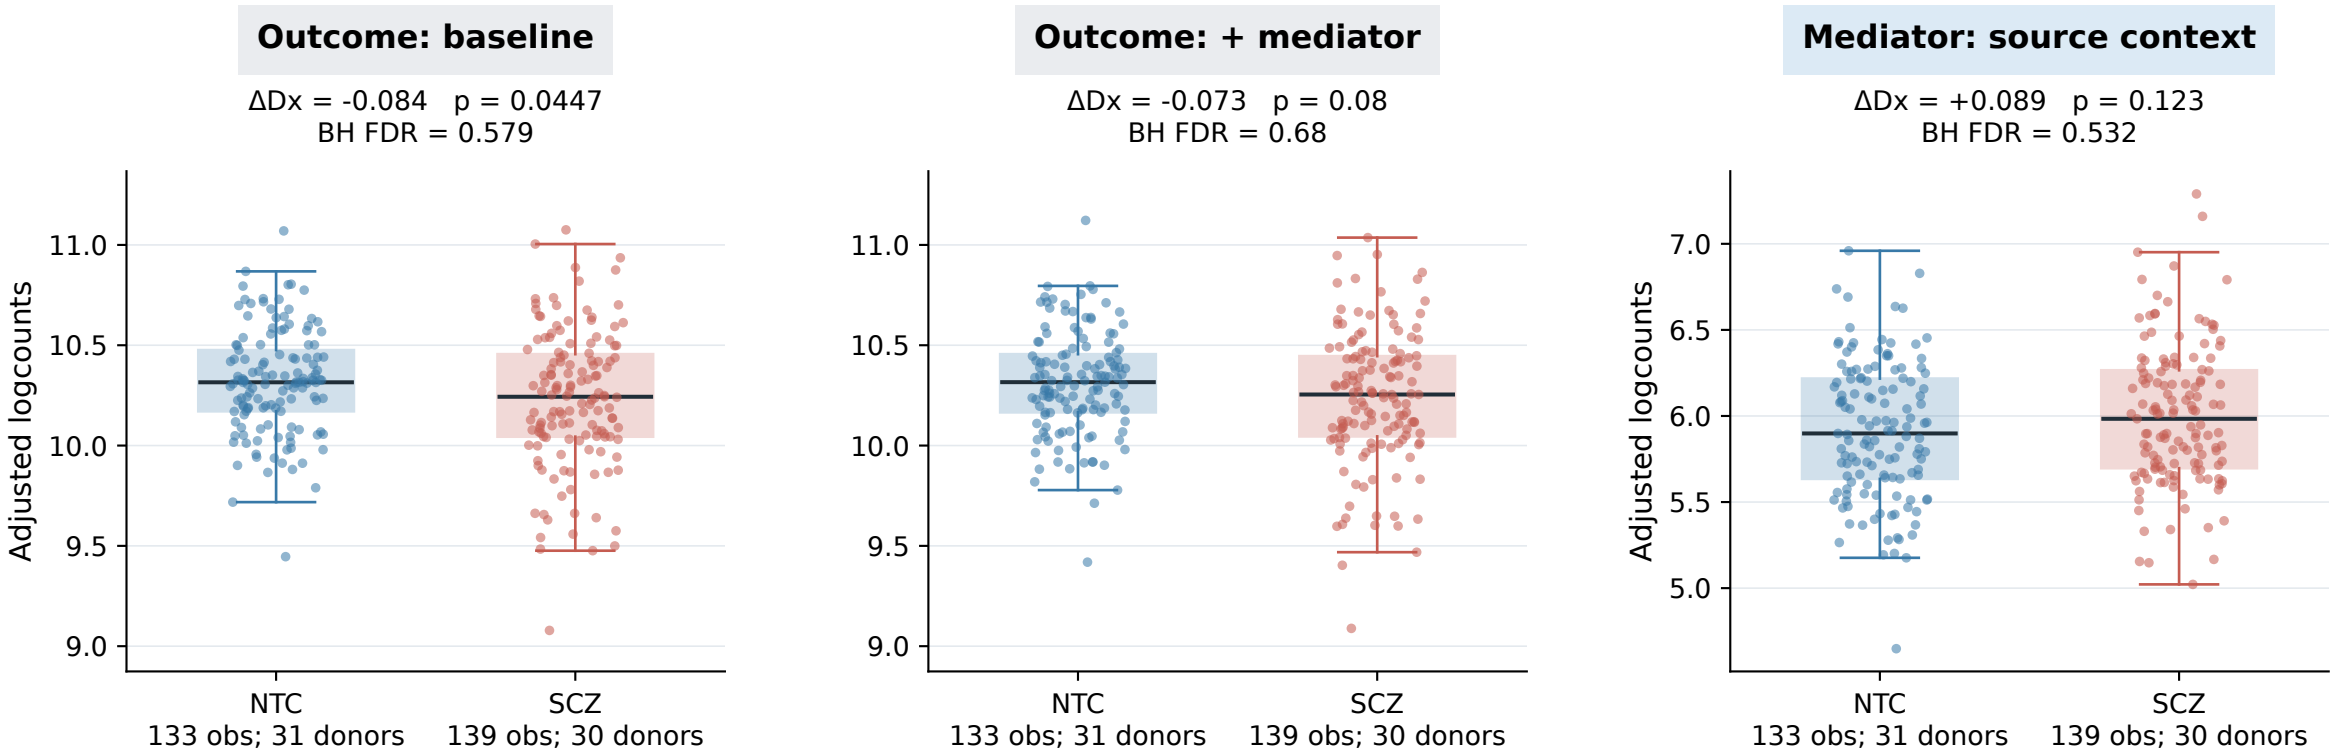
GAP43 [vascular] | FGF1 [neuropil]

Matched donor–SpD observations · 61 donors · 272 observations

fgf1_neuropil_vasc | ENSG00000172020 | Nominal screening candidate



Conditional FGF1–GAP43 association: b = -0.084 per mediator SD, p = 0.00571, BH FDR = 0.0668 | Dx attenuation = 13.6%

Values remove centered age, sex and SpD effects; middle panel also removes the centered mediator effect.

ΔDx = SCZ − NTC. P-values/FDR are from the original donor-blocked limma fits; boxes supply no new statistical tests.

Each point is a donor–SpD observation; multiple points from one donor are not independent. Shared outcome y-axis.

Selection: Named in Results 2.4 for neuronal structure/outgrowth among PRS-associated genes. Its occurrence in both FGF neuropil-to-vascular screens merits comparison; a vascular SPG label does not establish endothelial origin.
